

# GENERAL RECYCLED™ FR COVERALLS

As a result of the extensive R&D efforts at our recycling centre, a unique system of post-consumer recycling of aramid fabrics has been created. Rather than disposing of used garments and sending them to landfills, technology now allows us to recycle the fibre from used coveralls and reprocess it into new ones. Based on thorough testing of the recycled fabric, it has been proven that the recycled material has the same properties and performance characteristics as that made from virgin aramid fibres, and meets or exceeds the North American “flash fire” and “arc flash” standards for personal protective equipment. (CGSB 155.20-2000, NFPA 70 E)  
This process has enabled us to provide an environmentally responsible and economically sound closed loop cycle solution for FR work wear.”

The new protective garments meet all industry standards

- CGSB 155.20-2000  
- NFPA 70E

We take back old coveralls for recycling which keeps them out of the landfills

The recycled fibre has the same inherent fire resistant properties as the virgin fibre
